DataVaccinator patent and regify to power Regipost.com

Luxembourg, 17 August 2023 – DataVaccinator’s patented innovation and regify’s cybersecurity and SaaS expertise power www.regipost.com, the simplest service for secure data exchange.

Successful digitisation is unthinkable without the simple exchange of data. Regardless of whether a patient wants to give his doctor a copy of a letter from his health insurance company, the residents' registration office needs to send a citizen a message or a tax advisor or lawyer sends documents to his clients: the simplicity of the procedure determines whether it is accepted. Not infrequently, digitisation fails at the outset because the user is expected to do unnecessary work. Fortunately, data protection laws (e.g. GDPR) do not require users to carry out a lot of preparatory work for data exchange, such as time-consuming authentication, login procedures or agreeing on long passwords.

CTO Volker Schmid notes: “With regipost, we enable exchanging data securely with minimal effort: without registration, without an app and without a long password, thereby lowering the threshold for users to the absolute minimum.”

About DataVaccinator

DataVaccinator protects your sensitive data and information against abuse. At the very moment when data is being generated, the DataVaccinator service splits that data and uses advanced pseudonymisation techniques to separate content from identity information. Thus, the DataVaccinator service reduces cyber security risks in the health, industry, finance and other sectors and supports service providers, device manufacturers, data generating and data handling parties to manage sensitive data in a secure and GDPR-compliant manner.
